PUBLIC SAFETY NATIONAL COORDINATION COMMITTEE

+ + + + +

INTEROPERABILITY SUBCOMMITTEE MEETING

+ + + + +

THURSDAY,

NOVEMBER 15, 2001

+ + + + +

The meeting was held at 12:43 p.m. in Salon A and B of the Brooklyn Marriott Hotel, 333 Adams Street, Brooklyn, NY, Michael Wilhelm, Chair, presiding.

SUBCOMMITTEE MEMBERS PRESENT:

    MICHAEL WILHELM - CHAIR
    JOHN POWELL
    GLEN NASH
    ROBERT F.SCHLIEMAN
    TOM TOLMAN
    TED DEMPSEY

ALSO PRESENT:

    JOHN OBLAK
    WAYNE LELAND
    TIM GOODALL
    DAVID BYRUM

ALSO PRESENT: (Cont.)

CLARK PALMER
DAVID EIERMAN
RON MAYWORM
CARLTON WELLS
RICK KEMPER
BOB FENICHEL
DAVID PICKEREL
PAUL MAY
DAVE FUNK
ALI SHAHANI
FRED GRIFFIN

A-G-E-N-D-A

1   P-R-O-C-E-E-D-I-N-G-S

2   (12:43 p.m.)

3   MR. POWELL: We will reconvene the joint

4   meeting and finish up this afternoon with the

5   interoperability subcommittee.   There should be an

6   agenda, and one handout attached to that agenda.

7   Copies are in the back of the room beyond what I

8   passed out to people.

9   I'm going to, as usual, ask Bob Schlieman

10   to serve as secretary.   Michael indicated he has no

11   opening comments.   Again, as usual, anyone that is

12   interested in joining any of the working groups, that

13   is not already involved, please see me or see Bob, and

14   we will add your name to the list of the working

15   groups, and make sure that it is added on the list

16   serve.

17   There is an agenda. I will note that I

18   messed up on the date on the agenda, it should be the

19   15th. The document number appears to be correct. Do

20   I have a motion to accept the agenda? Rod Mayworm.

21   Second?

22   MR. WELLS: I will second.

23   MR. POWELL: Carlton, thank you.

24   The minutes for the meeting in Washington,

25   actually that should be for the meeting in St. Louis,

1 and I will make that correction, are locked in my

2 computer, I cannot get them out. The computer

3 glitched on the airplane last night, so I will

4 circulate those on the list serve, and we will have to

5 take them up at the next meeting.

6   I do have an updated document list that is

7 about four pages long, now. I did not copy that. I

8 will also circulate that on the list serve. With

9 regards to working group activities, Bob, anything on

10 report drafting for the next interim report, that is

11 scheduled for --

12   CHAIR WILHELM: There is no schedule.

13   MR. POWELL: No schedule for it at this

14 point.

15   MR. SCHLIEMAN: Still in process.

16   MR. SCHLIEMAN: In process for this

17 subcommittee. Operational requirements, Kyle isn't

18 here. However, there were, earlier, some PSWN

19 representatives here who are working with Kyle on

20 operational requirements, and I don't see them back in

21 the room yet, so we will take that out of order when

22 they return.

23   Carlton, you had some issues you wanted to

24 address. I will turn it over to you as chair of

25 working group 3.

1   MR. WELLS: This will be really short and

2 superficial. What you should have seen already, via

3 the listserve, are two documents. One is from a

4 previous distribution that I put out again.

5   But they are really intended for a

6 preliminary review as working drafts. I have nothing

7 prepared today to present, and really open up for any

8 lengthy discussion. But what you will see, in those

9 two documents, on one of them is identification of

10 various issues brought up in the fourth report and

11 order.

12   Up to this point we have been discussing

13 narrow band, primarily. And when you read the fourth

14 report and order, your focus may be narrow band. But

15 when you look at some of those issues, they can be

16 applied to wide band as well, and I didn't see the

17 fourth report and order that said specifically narrow

18 band.

19   So I opened it up to apply them to wide

20 band and start a working draft of which ones may carry

21 over into wide band, rather than reinventing the

22 wheel, we just go back and reference the wheel that

23 exists already.

24   That is merely a reference document, not

25 something, I think, to really consider for passing as

1 recommendations, but merely work from, in developing

2 recommendations in wide band.

3 The second document that was distributed

4 is an initial attempt to start developing some areas

5 in wide band as far as labeling wide band channels,

6 and other actions that we've already done in narrow

7 band, at this point.

8 Again, not to reinvent the wheel, but to

9 keep the wheel turning for consistency on how we have

10 labeled, or addressed narrow band channels that we

11 addressed similarly in wide band, so we don't have a

12 different story to tell, it is the same story, a

13 different chapter, wide band.

14 So if you haven't responded on the

15 listserve to that, don't feel bad, there is still

16 time, I think. In the future, when those become more

17 realistic, and less what I would tend to call them

18 right now, glass house. They are primarily my ideas

19 put on paper.

20 And when it looks like discussion that is

21 going on, that is me being schizophrenic talking to

22 myself, and carrying out a dialogue to come up with a

23 conclusion that may make sense.

24 But, please, do put your input into it, so

25 that future work on those can arrive at a consensus at

1 | a future meeting.

2 | MR. POWELL: Thank you, Carlton. I also

3 | have, and I believe it was circulated on the

4 | listserve, although I'm not sure, an updated regional

5 | convener and chair list. Again, I only printed out

6 | one copy of that. If anyone is interested in that

7 | list, how many are on it here?

8 | There are 31 regions listed on this list.

9 | I received this from Don on the 13th. I will make

10 | sure that it got on the listserve. And if you have

11 | any questions regarding your region, or adjacent

12 | regions, and want to see the list, I will have a copy

13 | of it up here.

14 | Anyone from PSWN come back into the room?

15 | It doesn't look like it. Dave Buchanan distributed,

16 | back on June 20th, a document to begin discussion on

17 | common addressing method for the low speed data

18 | interoperability channels.

19 | And I want to -- that document is attached

20 | to the agenda. Hopefully people have had an

21 | opportunity to read that over, and at this point,

22 | since Dave is not here, I would open discussion, if

23 | anyone has any comments on that document.

24 | What he is proposing is that we look at an

25 | internet protocol based identification scheme. And he

1 | has identified the internet class B addressing, which

2 | allows a range of subnets, as well as hosts. In fact,

3 | up to over 16,000 hosts in each of the two subnets.

4 | Let's put it this way, there is a lot of

5 | different options that are possible. The standard

6 | that we've adopted does support the capability to

7 | handle IP addressing, and protocols, using a gateway.

8 | Also fixed infrastructure will support it.

9 | He mentions, in the second to the last paragraph, that

10 | security is a concern, and that we do need to maintain

11 | a data base of domain names. And the cross-referenced

12 | internal serial numbers that would be associated or

13 | validated against each of the domain names.

14 | Carlton?

15 | MR. WELLS: One thing that jumps out in

16 | the third paragraph, who would be the sponsoring

17 | agency to manage this.

18 | MR. POWELL: He brings that up in the last

19 | paragraph, that we do need a sponsoring organization,

20 | or an agency, to apply for the domain name, and IP

21 | class B address on a nationwide basis.

22 | What he is proposing is that each state

23 | would then be assigned a subnet address, or addresses

24 | to be used at incidents, with the states managing

25 | those IDs. I assume it would be an agency within each

1   state managing those IDs.

2   Those of you coming into the room, now,

3   there are some handouts on the back table, if you

4   didn't get one already.

5   MR. WELLS: For instance, each state who

6   establishes the administrator for the interoperability

7   channel, maybe by default consider that as a first

8   option.

9   MR. POWELL: Yes, that is something that

10   we needed to address, and that is probably the logical

11   place, would be either the state interoperability

12   executive committee, or the regional planning

13   committee, if that committee doesn't exist in the

14   state, following along where the FCC rules are for

15   those committees.

16   I'm assuming, if we wanted to get a dotgov

17   type of address, that we would need a government

18   agency that is statuted to get one of those addresses,

19   to be able to do that. I don't know if there is

20   anyone in the room that wants to volunteer for that,

21   but that certainly is something that we need to

22   discuss, and probably should get going.

23   There have been, in other forums, similar

24   discussions on this addressing for use of these

25   channels within the project 25 protocol. In fact,

1 project 25 itself, has had significant discussion on

2 this topic.

3   John, would you care to elaborate? I have

4 not been party to all of those discussions. I know

5 that within TIA there has been a lot of talk about how

6 we can make this work.

7   I think Dave brings up a very valid

8 concept, here. At this time let's -- we will continue

9 this to the agenda for the next meeting, and ask that

10 people, through the listserve, get their comments

11 back.

12   Hopefully between now and then we can

13 identify a host organization that would, at least,

14 acquire the initial domain name that we could then use

15 to start breaking these out from.   We will pound on

16 Michael.   That is kind of the logical one to me.

17   Any further comments on this item?

18   (No response.)

19   MR. POWELL: I don't see anyone from PSWN

20 back in the room, we will have to come back to that.

21   From this morning's meeting we agreed,

22 this afternoon, that we would discuss an encryption

23 algorithm and standard recommendations. To begin that

24 we have the benefit of having someone with us, today,

25 who used to work for National Communication Systems,

1 retired from there, but has a significant amount of

2 background in the encryption area, and I asked him,

3 after we adjourned for lunch, if he would care to give

4 us some history on DES, and where MCS, and the other

5 federal standards organizations were moving recently,

6 as well as what we could expect the lifetime of some

7 of these standards to be.

8 So, Bob Fenichel, if you want to come up

9 and introduce yourself, tell us what you are doing

10 now, and give us some background on encryption.

11 MR. FENICHEL: I'm Bob Fenichel from the

12 National Communications system, and my retirement is

13 four and a half months away. I have been talking

14 about it for a while, but --

15 MR. POWELL: Yours and a whole bunch of us

16 in the room, I think, Bob.

17 MR. FENICHEL: Not here yet, but close.

18 I've been involved in standards for about

19 25 years, and I was involved in the early days of the

20 DES standard. And I can say that the DES standard is

21 about 25 years old, probably.

22 The development of the DES algorithm

23 probably took place between 25 and 30 years ago. So

24 it has been around a while, and it has lasted a while.

25 And one of the things that was mentioned this morning

1   was that the DES algorithm was broken.

2   And I think from a cryptographic point of

3   view, that is not correct, in that with any encryption

4   algorithm, if you have matching plain text, and cipher

5   text, and you try every possible combination of key,

6   eventually you will find the right one.

7   And that is true with all algorithm. And,

8   to the best of my knowledge the DES algorithm has not

9   been broken, in that there has been no shortcut

10 solution found. However, it, as was mentioned, is not

11 recommended for new implementations, because with tens

12 of thousands of computers it is possible to, and I

13 don't know if it is days, or weeks, or months, or

14 whatever it is now, try all the keys and find the

15 right one.

16   I think when DES was developed, 25 years

17 ago, the life of it was never anticipated to be this

18 long. It was only intended to be 10, or 15 years or

19 so. So it has had a useful life.

20   As far as Triple DES versus the advanced

21 encryption standard, I think really either one would

22 be suitable. I think the advantage, off-hand, for the

23 AES, is that it is much less computationally complex.

24   That was a major consideration 25 years ago. Perhaps

25 with today's technology that really doesn't make too

14

1 much difference these days.

2 And the advantage of triple DES, one is

3 the backward compatibility to DES that was mentioned

4 earlier. And the other is that, I believe, there is

5 an ANSI standard for the triple DES that has been in

6 existence in the banking community for a number of

7 years now. So you could say there is a triple DES

8 ANSI standard.

9 And I would just say that I think both

10 triple DES and AES will be around for quite a while.

11 And I think the decision, personally, to not recommend

12 the use of the DES, was a somewhat conservative

13 decision on the part of NES.

14 I think that people on the security

15 business tend to be very conservative. But if you did

16 change keys periodically I think that it would be

17 usable for a lot of applications, even though the

18 official disposition is that it is not, you know,

19 really recommended. They try to encourage the use of

20 triple DES or AES instead.

21 And those are, really, the thoughts that I

22 had to give to the group. Thank you.

23 MR. POWELL: Thank you, Bob. At this

24 point what I would like to do is, if I have to single

25 people out, hopefully I won't have to do that. We

1 have at least one major federal agency in the room,

2 sitting in the back there.

3   If we can get, perhaps, some comments on

4 your feeling? Because it would be, certainly the

5 Bureau is going to be one of the -- in the law

6 enforcement arena one of the, if not the major federal

7 agency that we would be working with from an

8 interoperability standpoint.

9   So if I could get some comments on where

10 you think you might be going, or where we should be

11 going, I would solicit those. You don't have to talk

12 if you don't want to, but hopefully we can get

13 something.

14   Otherwise we can just open the floor up

15 for discussion. I'm hoping that we can arrive at a

16 recommendation to go to the technology subcommittee

17 today. The mike is open.

18   MR. ASHLEY: Dan Ashley, FBI, representing

19 FLEWUG.

20   Not speaking for the Bureau, but speaking

21 from my knowledge of what the direction at this point

22 is, the federal government will be going to AES. They

23 will be stepping over out of the DES platform.

24   There is still some discussion whether

25 triple DES will be used as an interim. But as soon as

1   AES is fielded the federal government will transition

2   to AES.

3   My personal recommendation on that would

4   be, since it doesn't appear that the equipment is

5   going to be fielded for a little while, yet, in the

6   700 MHz band, my recommendation would be to go with

7   the AES, plan for that platform, and go into the

8   future with the most current encryption available.

9   I'm not speaking from the Bureau point of

10   view, because I'm not in a position to do that. But I

11   know that the mandate is to go to AES as soon as it is

12   fielded.

13   MR.   POWELL: And, John, we are

14   anticipating that fielding being mid-year of the

15   coming year, is that correct?

16   MR. OBLAK: (Not miked.)

17   MR. POWELL: Mid-calendar year 2002, as

18   far as the standards development at this point. Bob

19   Fenichel, do you have any comment on what is NCS is

20   looking at on having that out?

21   MR. FENICHEL: I don't know.

22   MR.   POWELL: Any other comments?

23   Manufacturers, if we were to, at this point, recommend

24   that the standard, which we did find -- Michael, where

25   is that -- it actually is in the rules as DES.

1 90.553. There is an incorrect reference somewhere

2 else in there.

3   The reference in that section is not

4 complete. But, nonetheless, the intent is there to

5 reference single DES, just DES, as the standard.

6   So for the manufacturers that are here, if

7 we were to recommend to the Steering Committee,

8 through the Technology Subcommittee, that they

9 petition the Commission to change that to AES, is that

10 going to be a problem? Paul, John, Motorola

11 representatives, there are several here, others?

12   And also if you would comment on your

13 feeling on gateways with regards to backward

14 compatibility, or cross-banding to other users.

15   MR. ITTNER: Al Ittner, from Motorola.

16 The question of encryption is an option. So if the

17 question is, can we field the equipment in 700 without

18 knowing the AES/DES decision, the answer is yes.

19 There would be clear radios without any encryption in

20 them.

21   We would wait, obviously, to see what the

22 decision is between AES and DES before we start

23 designing and developing radios with one of those

24 encryption standards in it. And then it would be the

25 -- I think I don't have a set time in terms of how

1   long after the decision is made.

2   Generally we have used a 9 month to 18

3   month kind of time frame, but I don't know if that

4   applies, I'm not in engineering enough to be able to

5   tell you whether that is the development cycle for

6   that standard.

7   So the answer is we would be able to field

8   radios without encryption in them, and are planning to

9   do so. But certainly have to wait for your decision

10 in terms of AES or DES.

11   MR. POWELL: Thank you.

12   MR. OBLAK: John Oblak from E. F. Johnson.

13   Currently all of our product that is

14 project 25 compatible is -- has been fielded with DES

15 encryption to the project 25 standards.

16   We   currently   don't   have   an   AES

17 implementation. However, we don't feel that there is

18 a technical reason why we couldn't, we just have not

19 fielded anything other than DES at the moment.

20   I would say if we had a preference, I do

21 believe in the theory of the common denominator,

22 baseline technology. I think that is where we've gone

23 in all of the decisions that have been made in terms

24 of interoperability that we chose a standard that was

25 baseline.

1   And, certainly, we do have an install base

2   in other bands that include a number of

3   implementations with DES. And, therefore, for

4   complete interoperability I would say that the

5   baseline of technology being the DES standard would be

6   the most likely candidate, in our preference, for

7   standardization.

8   MR. POWELL: Thank you, John. Paul,

9   comments?

10   MR. MAY: I guess I'm just going to

11   reiterate what I think I said earlier, which is that

12   we would prefer to see the AES as the standard, start

13   fielding equipment.

14   We too may end up having to ship units

15   that initially do not have an encryption capability

16   for the interoperability channels. From my

17   discussions with our folks I don't believe that there

18   is anything that precludes us from doing that kind of

19   upgrade in the field as a software type feature.

20   I don't think there is a hardware

21   difference that would significantly impact the design

22   of the radios, that sort of thing.

23   MR. POWELL: How about dual algorithm

24   radios?

25   MR. MAY: As far as I'm concerned it is

1 all a question of code space in the radio. You know,

2 typically radios will ship with one to two megacodes

3 base, and how we partition and use it up is pretty

4 much a commercial decision.

5   Generally you don't operate both of them

6 at the same time, so it is a fact of paging one in and

7 out. Like I said, I think that is in the realm of

8 possibilities.

9   MR. POWELL: Any other manufacturers here

10 that would like to speak?

11   (No response.)

12   MR. POWELL: Okay. Users? There must be

13 some opinions out here.

14   MR. ASHLEY: Don Ashley, again. This time

15 I'm going to put my PSWN hat on and I'm inclined to

16 agree with John Oblak, that the lowest common

17 denominator is really the important point here.

18   And I would just suggest that the lowest

19 common denominator for interoperability is still clear

20 text. It is fine that everybody may have encryption,

21 but even when you bring groups together who do not

22 normally communicate together, the lowest common

23 denominator, even if they are encrypted, is to bring

24 them back to a clear text condition, bring them to a

25 switch, and then feed them back out on another radio

1   system.

2   And that is how most or many organizations

3   are establishing interoperability. So the decision of

4   whether, what the encryption is, may not be as

5   important at this point as it seems to be, because the

6   lowest common denominator is still clear text audio.

7   MR. POWELL: Except that we are talking

8   about encryption here. So if we are talking about the

9   lowest common denominator for encryption. Now, if we

10   go back to what Bob Fenichel said, earlier, that a

11   triple DES standard exists, and we know that triple

12   DES is backward compatible to DES by simply loading

13   the same key three times, if we were going to say DES

14   was the lowest common denominator, would we not be

15   better off to say triple DES was the lowest common

16   denominator, because we can make it backward

17   compatible to DES, and it offers that additional

18   security?

19   I don't hear anybody saying no.   Don, for

20   the federal agencies, as they migrate to AES, do you

21   anticipate them keeping radios backward compatible to

22   the DES standard?   Is that going to be a problem, say

23   second generation radio from now, as the agencies all

24   convert to AES, that ten years out we might not have

25   the capability?

1   MR. ASHLEY: That I can't answer, because

2   I'm not sure how much funding will be applied to

3   upgrading radio systems. As you know the federal

4   mandate to upgrade to narrow band is ongoing at this

5   time.

6   In that process of upgrading radio systems

7   and going narrow band they probably will also, or at

8   least the major law enforcement agencies will foot the

9   bill to go to AES as quick as possible. But how

10 quickly that will happen, I don't know. I don't think

11 anybody knows.

12   MR. POWELL: Paul?

13   MR. MAY: I guess the one comment I would

14 make on triple DES is, to my knowledge, there is no

15 commercial mandate to go out and develop that

16 technology. So other than the deliberations in this

17 committee, you look at the federal market, if they

18 move to EAS then obviously, from a manufacturing

19 perspective is a lot of clout to develop the EAS

20 capability, as opposed to triple DES.

21   I'm unaware of too many customers that

22 have come up to us and requested that capability.

23   MR. POWELL: I'll throw that back out on

24 the floor. Is that the case? Certainly we don't want

25 to pick out something that makes 700 a niche market

1 for this product, where it wouldn't necessarily be

2 developed, perhaps, in other bands.

3 MR. WELLS: If I heard him correctly,

4 should the Federal Government take on the AES, and the

5 manufacturers build AES equipment, and the NCC

6 recommends DES3, there may not be DES3 equipment to

7 comply with the NCC recommendation.

8 MR. POWELL: Or it might be real

9 expensive.

10 MR. WELLS: Yes, prototype prices.

11 MR. POWELL: Right. So what is the

12 recommendation of the group? Nobody wants to speak

13 up.

14 MR. WELLS: Well, if we stayed with the

15 DES right now, again, if the manufacturers are

16 building AES in the future, then are we still on an

17 island, staying to the existing FCC rule on DES right

18 now?

19 It is like we are being forced into a de

20 facto standard over time. Because if we stand on DES

21 today, tomorrow would DES still be manufactured, or

22 will it go away to the AES mass market?

23 MR. POWELL: There is a significant

24 imbedded base of DES out there. But I believe that

25 most of that significant base in the Federal

1 Government, which over time will convert. Certainly

2 there is some at state and local level.

3 MR. WELLS: It is like we are the tail

4 trying to wag the dog here.

5 MR. POWELL: You just walked into the

6 room, it is your turn.

7 Well, certainly in other technologies we

8 always propose going with state of the art if there is

9 a benchmark. And unlike waiting to pick the best

10 computer where we never make that choice, there is a

11 benchmark on the horizon.

12 And equipment is in development, but

13 generally not yet fielded. Perhaps in type acceptance

14 at this point, for the band. Potentially some delays

15 in fielding. Encrypted radios, if we were to wait, or

16 recommend that we wait for AES, my personal feeling is

17 that it is probably worth that wait.

18 Certainly nothing prohibits an agency from

19 asking for dual mode radios. We are starting with one

20 and asking that the equipment be flash upgradable to

21 take the other one later on.

22 Well, actually, Bob Schlieman made the

23 comment, assuming it has the code space. But from

24 what Bob said, if it as flash upgraded AES with AES

25 being a much less complex algorithm to implement, I

1 think one could assume that if you had DES implemented

2 you should be able to put AES in the code space.

3 Should?

4 What is the will of the group? Somebody

5 needs to speak up.

6 MR. WELLS: My gut feeling is that we look

7 to AES, not discount it but look toward it, realizing

8 we've got a DES in rule right now. But looking toward

9 AES, will it stop us from implementing an encryption

10 standard that is already adopted in anticipation of

11 AES to come, but again, it is difficult for us to

12 adopt an AES standard that hasn't been developed yet.

13 MR. POWELL: That is true.

14 MR. WELLS: Catch 22 right now. And when

15 AES comes about will the NCC be in existence to look

16 at it?

17 MR. POWELL: Certainly if it meets the

18 date that people have been throwing around the NCC

19 will be here. I think the key issue at this point is

20 Glen Nash brought up this morning, we need to put the

21 manufacturers on notice that we are looking at

22 proposing that that encryption standard be changed if

23 indeed that is what we are going to propose. In all

24 fairness I think we need to do that.

25 And if that is the consensus of the group

1   here, then I think what we should do is recommend to

2   the technology subcommittee that the bring forward to

3   the Steering Committee, tomorrow, a recommendation

4   that at least a letter go to the Commission, and to

5   the manufacturers, suggesting that as soon as the AES

6   standard is developed that we change, request the

7   Commission to change the rules to mandate that

8   standard on the interoperability channels.

9   MR. SCHLIEMAN: The whole encryption issue

10   is a multi-standard issue with respect to the ANSI 102

11   series of radios. The standard that is currently in

12   the FCC rule 90.553 is the DES definition.

13   I'm just looking to pull it up again. It

14   is project 25 DES encryption protocol. There are a

15   whole set of standards that define encryption, and

16   that is sort of like an overview document.

17   The one I mentioned earlier in the

18   technology subcommittee meeting, AAAD is the

19   definition of the -- just a moment, I will bring that

20   up. I almost think that is a replacement for AAAA.

21   IT opens up by saying that this standard was developed

22   with inputs -- the standard expands the material given

23   in AAAA. However, this standard incorporates, and is

24   completely compatible with that standard.

25   Essentially AAAD will give you the three

1 choices of algorithm. And it will be done through the

2 NX mechanism, so that the standard will not have to

3 change as a standard.

4   MR. OBLAK: That is correct. The block

5 encryption standard document really is a replacement

6 for the DES document, and is a more generic document

7 that describes the three encryption algorithms that

8 were mentioned, plus potential others.

9   So it is a more generic document that

10 replaces the DES document.

11   MR. SCHLIEMAN: Since it is not completed

12 balloting yet, it would be premature to try to act on

13 that in the NCC. Having said that, if it were not in

14 that state, if it was a completed ANSI standard, I

15 would recommend that it be used to replace the

16 standard that is expressed in 90.553, and that we then

17 discuss the algorithm that will be used as the --

18   And I think that could be expressed,

19 maybe, in terms of some variables that would allow AES

20 to be used when it becomes available. In the

21 meanwhile DES compatible algorithms would be

22 acceptable as the lowest common denominator.

23   And the issue of NXC besides specifying

24 the AES algorithm also specifies that in a project 25

25 radio implementation, the radio, if it is implementing

1 AES, must also implement a DES compatible algorithm.

2 So it could be either triple DES, or DES

3 itself, as defined in annex B and A respectively. It

4 would seem that we could, perhaps, craft something

5 around that would still allow us to have accurate

6 compatibility to imbedded base equipment, not

7 necessarily imbedded in this band, but it could be

8 imbedded in adjacent bands, like 800.

9 Which, in fact, could be actually treated

10 as all one band, 700-800, and other bands, of course.

11 MR. POWELL: The issue is that we need to

12 pick one standard. And if it happens to include that

13 backward compatibility, that is a plus. Otherwise we

14 may be looking at gateways, and bringing step back to

15 clear text re-encrypting it, pass it on to other

16 systems, whatever we have to do.

17 That, of course, brings up other problems

18 in doing that.

19 MR. SCHLIEMAN: Could we perhaps, because

20 this is not a completed standard at this point, I'm

21 referring to AA/AD, could we perhaps make a statement

22 of intent that would be passed on to the Commission to

23 guide them in what needs to be done, or what will need

24 to be done?

25 And then -- because they have an error to

1 correct in that 90.553, anyway. So they are going to

2 do something. And maybe they want to wait until we

3 finish with this thing, as soon as it becomes

4 available, to finish with it.

5 MR. POWELL: That was my suggestion for

6 the letter, is to alert them that we were looking at a

7 change. And I think more importantly than the

8 Commission, though, is to alert the manufacturers that

9 we are potentially looking at a change.

10 And, again, back to the group. No

11 comments from anyone? I know from discussions this

12 morning with Glen, and a couple of other people that

13 are not here right now, that they all felt that we

14 should be looking towards AES as the standard here.

15 MR. SCHLIEMAN: And, John, I thought I saw

16 a couple of nods in the audience when we were heading

17 in that direction. So I'm hearing no objections.

18 MR. POWELL: No objections. Well, here is

19 what I would propose that we take to the technology

20 subcommittee, then. Is a recommendation that they

21 move towards AES. And at this point send to the

22 Steering Committee a letter indicating that, and

23 request that they forward that to the Commission, as

24 well as to the manufacturers.

25 That once the AES standard is complete,

1 | and included within the ANSI documents, that that

2 | become the standard. It will require a rule change,

3 | but that become the standard for this band.

4 | Now, do we have any objections to that?

5 | MR. SCHLIEMAN: Could we expand on that a

6 | little bit?

7 | MR. POWELL: Sure.

8 | MR. SCHLIEMAN: Could we word it so that

9 | we express our intention to change the recommendation

10 | when it becomes available as an ANSI standard, to go

11 | to ANSI TIA/EIA 102.AAAD, using the NXC AES algorithm?

12 | MR. POWELL: Sure. Does that meet with

13 | the consensus of the group? Okay, I see heads

14 | nodding, not shaking.

15 | Okay, that is what we will do, then. We

16 | will recommend to the technology subcommittee that

17 | they proceed along that line. And at least hopefully

18 | tomorrow Mike will have time to get a letter to the

19 | NCC Chair indicating that. Find some time in the

20 | agenda to get a letter up so that people are on notice

21 | to the fact that equipment is coming down the line

22 | fast, now.

23 | Any further discussion on this item?

24 | (No response.)

25 | MR. POWELL: Since I know there are some

1 PSWN folks in the room now, going back to working

2 group 2, operational requirements, do we have anything

3 further along the incident command system?

4   A lot of information was passed out on

5 that in the past. And, actually, there have been a

6 couple of other documents that I received over the

7 past couple of months, as kind of reference

8 information.

9   Nothing new on that? I will see if we can

10 -- I think those came out on the listserve, I will

11 make sure that -- there is one in particular that gets

12 circulated. And I don't remember the source for that.

13   But it was a well known organization.

14   And we will go ahead and circulate that so

15 that we can -- I would like, at the next meeting, to

16 be able to make some kind of final recommendation to

17 the Steering Committee. We are at the point that we

18 need to do that, on the incident command system.

19   Certainly I think if you look at recent

20 events, where it was used very successfully, and I

21 believe we will have some discussion on that tomorrow

22 from Steve Souder on his presentation on the response

23 to the Pentagon incident, multi-agency response.

24   This is signed by DAve. This was for the

25 November 16th meeting?

1   CHAIR WILHELM: That is on the agenda.

2   MR. POWELL: Okay. So this is going to

3   come up tomorrow as our recommendation. Great. Yes,

4   this is the expansion upon what we did from the last

5   meeting. Good.

6   So everyone should have that because it

7   was on the listserve?

8   MR. WELLS: Yes.

9   MR. POWELL: Okay. We will move that

10   forward, then. And I should get together with you,

11   Dave, because we've got a couple of items to go to

12   them tomorrow. So put that all together.

13   Will you be doing that, or --

14   MR. PICKERAL: David Pickeral, Booz,

15   Allen, Hamilton PSWN program support. Bob Lee who is

16   the PSWN program manager for Justice, who is not here

17   yet, will be discussing that document and that issue

18   tomorrow.

19   MR. POWELL: When do you expect him in?

20   MR. PICKERAL: Later today. We are not

21   aware, he is coming up from Washington, probably as we

22   speak.

23   MR. POWELL: I should probably talk to him

24   before so we can get that coordinated.

25   MR. WELLS: Also, John, if I may add? For

1 tomorrow's discussion, this document refers to certain

2 ICS forms in case questions come up regarding those

3 forms.

4 Could those be ready for presentation if a

5 question comes up, to show? For myself, I'm not

6 familiar with form 16, 217, 204, and since they are

7 incorporated in this document I would feel good being

8 able to actually see those forms to know that this is

9 all-encompassing.

10 MR. POWELL: Or at least have a

11 description of what they are.

12 MR. WELLS: Yes.

13 MR. POWELL: Certainly I think a number of

14 us in the room are familiar with the 204. Dave, can

15 you make sure that there is at least a verbal

16 description available on what those forms are that are

17 referenced in there?

18 MR. PICKERAL: Yes, we can do that.

19 MR. POWELL: Just shout loud, the mike

20 will pick it up. Okay, thank you.

21 Do we have any other business for the

22 interoperability subcommittee? I will get together

23 with -- Michael?

24 CHAIR WILHELM: I'm trying to take

25 advantage of the fact that we have a somewhat captive

1 | audience of manufacturers here.

2 | What, if anything, does this committee or

3 | the Commission have to provide in order for you to

4 | proceed to the final design phase of the 700 MHz

5 | radios?

6 | MR. LELAND: Wayne Leland, Motorola.

7 | I think the overriding issue for

8 | manufacturers, at least for Motorola, is getting

9 | access to spectrum. If there is no market because

10 | there is no spectrum, because the TV hasn't been

11 | cleared, the manufacturers are going to be reluctant

12 | to invest a lot of development money to bring out

13 | product until that is there.

14 | Especially in these times when everybody

15 | is cutting back significantly. So I think it is very

16 | key that -- and I know it is on the agenda for NCC

17 | tomorrow, on a panel, that we work towards whatever we

18 | can to get the spectrum cleared.

19 | New York, you know, there is no 700 MHz

20 | spectrum available in the city of New York, anyway. I

21 | see Bob squirming up there. The west coast, and major

22 | metropolitan areas, which we know is where the needs

23 | may be highest, given today's situations, just don't

24 | have access to it.

25 | So I think that is a key issue.

1   MR. POWELL: John?

2   MR. OBLAK: I would say, again, I agree

3 with Wayne. From a technical standpoint I don't

4 believe that there is anything that we are lacking

5 from the standpoint of direction, or rulemaking.

6   Obviously the issue of AES versus DES

7 will, you know, add an unknown into the equation. But

8 from the standpoint of what technology decisions need

9 to be made, I don't think that there is anything that

10 we are lacking at the moment.

11   MR. MAY: I guess I have to echo the

12 sentiments of both Wayne and John in terms of

13 technical standards. One thing you could do is throw

14 a lot of money at state and local agencies, and those

15 people who have spectrum, and that would help.

16   MR. POWELL: Other manufacturers in the

17 room applaud that comment, I see. That is probably

18 some users. Anything else, Michael? Ron Mayworm.

19   MR. MAYWORM: Ron Mayworm from the city of

20 College Station, Texas. As the Chairman of the Region

21 49 700 MHz planning committee, I was advised by the

22 representative of the state of Texas, Department of

23 public safety, that the state of Texas is intending to

24 notify the FCC that they will accept the

25 responsibility for the management of the

1 interoperability channels throughout the state of

2 Texas, and across the six regions that comprise the

3 state of Texas.

4   My first reaction was, this is good news.

5 They are concerned that the administration of the

6 interoperability channels be uniform throughout the

7 state. But as I got to thinking a little further, and

8 started looking through the rules as they sit, at the

9 moment, there is very little incumbent upon the state

10 in guiding them as to how they should be handling the

11 administration of these interoperability channels.

12   In the rules, currently, it only requires

13 that modulation on the interoperability channels be

14 project 25 phase 1; that there be two specific

15 interoperability calling channels, and that no

16 encryption be allowed on those; that there be a single

17 encryption method on the other interoperability

18 channels; and that there is a formula, if you wish,

19 for allowing trunking on certain number of the

20 interoperability channels.

21   Beyond that they are free to play in any

22 way they wish, unlike the requirements of a plan from

23 a regional planning committee being submitted to the

24 FCC for review, in which there could be uniformity

25 required by the FCC, there is no requirement upon the

1 state entities to submit anything, to anybody, as how

2 the interoperability channels will be used within

3 their states.

4 And certainly nothing that would require

5 any uniformity at the nation-wide level, which is what

6 we were all sent here to do, was to develop a nation-

7 wide interoperability plan.

8 I believe we may have abdicated our

9 responsibility by giving this much rein to the states

10 at this point in time. And I urge that, perhaps, we

11 take a good look at the current situation, and perhaps

12 urge the full committee, and the FCC to perhaps put

13 some teeth in how the states are allowed to manage the

14 interoperability channels.

15 MR. SCHLIEMAN: I agree partially with

16 what you said. And I would note that in FCC 0110, the

17 fourth report and order in 9686, there are

18 responsibilities. But the point that you made, I

19 think very well, is the fact that even in that

20 document there are really not standards for what we've

21 been trying to establish as standards in the

22 interoperability subcommittee.

23 And I think that is the really key point

24 there, that this needs to be encapsulated in some FCC

25 document that would serve, much as it did with 86112

1 | for 800 MHz. It is referenced throughout the rules,

2 | but they don't put all the details in the rules, they

3 | just refer to that.

4 | And I think we need a similar situation

5 | here to address the point that you made.

6 | MR. POWELL: I don't recall that there is

7 | even a requirement in there that they coordinate with

8 | adjacent states. So in theory the first one in could

9 | grab all the channels and use them all around the

10 | border, and all the adjacent states, which in some

11 | areas are many, on the interoperability channels --

12 | True, they are non-exclusive. But

13 | nonetheless having a coordinated use is going to make

14 | them significantly more effective. And that

15 | recommendation, logically, would be there some place,

16 | and I know it is in the implementation documents.

17 | But not any place that is binding, only in

18 | recommendations. That is a good point, Ron. Other

19 | comments from anyone else?

20 | Dick who is going to take over for your

21 | subcommittee at this point, since we are ready to

22 | recess for a little while. Ted was here earlier. It

23 | is 1:35. Let's take about a 15 minute -- we will

24 | adjourn this meeting and turn the podium over to Ted

25 | at 2 o'clock.

1   (Whereupon, the above-entitled matter went

2   off the record at 1:35 p.m.)
